Software Engineer, Full-Stack & Backend

EDUCATION

California State University, Sacramento, Sacramento, CA | *B.S. Computer Science* | December 2025

Cumulative GPA: 3.88/4.0; Magna Cum Laude; Dean's List 2023–2025

Relevant Coursework: Software Engineering; Operating Systems; Data Structures & Algorithms; Database Management; Computer System Attacks and Countermeasures

WORK EXPERIENCE

CE Showroom, Inc., Roseville, CA | *Software Developer* | July 2026 – October 2026

- Integrated 60+ data tables from two e-commerce marketplace API families into a bronze/silver/gold S3 lakehouse in ~12 weeks, with Step Functions orchestrating Lambda and Glue jobs from Aurora-stored configs, SQS job queues, and DynamoDB checkpoints that blocked duplicate runs (Python, SQL, Terraform).
- Owned multi-marketplace support end-to-end: extended multi-tenant connectors to process every marketplace per tenant and carried marketplace identifiers through the pipeline as deduplication keys, scoped so other API families were unaffected.
- Implemented configurable lookback windows with chunked, rate-limit-aware requests, recapturing late-arriving attribution data for 8 tables that would otherwise hold stale snapshots.
- Built an AI-assisted onboarding pipeline that cut endpoint onboarding from ~15 min of manual work per endpoint to parallel batches of 8–10 endpoints in ~15 min. An audit agent validated every generated config before release, and other developers on the team adopted the tool.
- Served as the developers' primary liaison to the CEO, breaking feature requests into scoped tickets.

Hackingtons, Rocklin, CA | *Code Instructor* | May 2025 – September 2025

- Provided real-time technical troubleshooting and code reviews in JavaScript and Python during live coding sessions with ~30 students weekly.

CSU Sacramento, Sacramento, CA | *Peer Assisted Learning Facilitator* | August 2023 – May 2024

PROJECTS

PickDays | pickdays.app | 2026

- Built and shipped a live group scheduling and availability web app with React, Vite, and TypeScript on Cloudflare Workers, Pages, and D1.
- Implemented a nightly scheduled Worker that purges expired events and participant data, plus server-side participant caps and input validation.

E-Waste Gurus, Customer Portal (Senior Project) | January 2025 – December 2025

- Built the API calls that populated the order, pickup, and invoice tables in a customer portal for a real e-waste recycling client (Vue/TypeScript frontend, PHP and MySQL backend, run in Docker).
- Wrote PHPUnit functional tests for the controller endpoints; the client ran user testing throughout.

Skin Cancer Detection App (Hornet Hacks Hackathon, Project Lead) | March 2025 | Demo | Code

- Led a 7-person team to a working MVP in 48 hours; built the Flask API serving a pretrained Hugging Face image classifier (80% accuracy) and set up GitHub Actions CI/CD.

SKILLS

Languages & Frameworks: Python (Flask/FastAPI), SQL, JavaScript/TypeScript (Node, React, Vue), Java (Spring Boot)

Cloud, Data & Tools: AWS (Lambda, Glue, Step Functions, SQS, S3, DynamoDB, Aurora RDS), Terraform, Cloudflare Workers & D1, PostgreSQL, MongoDB, Docker, GitHub Actions, Git, Linux, Jira
